

## **TalentFlow: AI-Powered Applicant Screening & Pipeline System**

### **[Problem Statement]**

Recruiters and hiring teams handling internship or job applications often receive many submissions with no efficient way to screen them. Manually reviewing every resume takes considerable time, especially when comparing each candidate against specific role requirements. Without a shared system, hiring teams also have limited visibility into each candidate's status and no organized way to share feedback.

### **[Objectives]**

**The Objectives of TalentFlow are:**

- To develop a web-based platform that helps recruiters screen and manage job applicants more efficiently using AI.
- To enable recruiters to create job postings and receive applications.
- To score each resume's fit against posting requirements using AI.
- To allow hiring teams to track candidates through a pipeline while collaborating through shared notes and ratings.

### **[Proposed Solution]**

TalentFlow is a web-based recruitment platform where recruiters post job openings and applicants submit resumes through an online form. An AI service analyzes each resume against the posting's requirements and generates a fit score with a short summary, helping recruiters prioritize their review. The hiring team manages applicants through a pipeline board (Applied, Screening, Interview, Offer, Rejected), sortable by AI score, and can add notes or ratings for collaborative decisions. The system includes secure authentication with role-based access for admins, recruiters, and team members. Expected users are recruiters, HR staff, and hiring team members.
